

Hello sir,

17-04-2017

Please see below doubts and small modifications in the project:-

- (1) Which algorithm has been used in this implementation for removal of stopwords ?
- (2) After running the code, when GUI appears, so there the 1<sup>st</sup> column is mentioned as *attributes* and 2<sup>nd</sup> column is mentioned as *categories*. I suppose these should be swapped (I mean the 1<sup>st</sup> column heading should be *categories*, as we are selecting categories and 2<sup>nd</sup> column heading should be *attributes*). So please justify this ?
- (3) When we are clicking on *Add Test Rule* button, so the test rules are automatically being loaded and also the *no. of occurrences in document* are changing in training phase. So, in the background what procedure/algorithm is running to select testing rules and accordingly training occurrences, means how these two phases are divided (is this any random procedure) ?
- (4) Till now in our GUI, we are able to select 4 training rules set. I think if we increase the no. of training rules, classifier will be more efficient. So please make the increase in number of rules set in training phase (upto 8 or 10 rules).
- (5) Please make little bit attractive GUI (like some color in background etc.).

Thanks.

- Ajeet
